Software Development Life Cycle and Agile Principles

Assignment-2

Objective:

Conducted a 30-minute mock interview to gather requirements for a fictitious mobile app that helps users organise and participate in community activities including local meetings, charity drives, seminars, and cultural festivals.

Interview Summary

The mock interview was conducted with a fictional stakeholder, Nirupom Saha, a community organizer who regularly manages local events. The purpose was to better understand her requirements, pain points, and expectations for the proposed application.

Key findings from the interview

- Current event planning is distributed among WhatsApp, Google Forms, and spreadsheets.
- Participants frequently miss updates or arrive unprepared owing to a lack of centralised communication.
- Tracking volunteer availability and gathering feedback is time consuming.

There is a need for a platform that can handle event planning, volunteer coordination, announcements, and post-event feedback.

Functional Requirements :

- a. User Authentication - It enables organisers and participants to sign up and log in securely.
- b. Create and Manage Events - Organisers can enter event information (name, date, location, and description).
- c. Volunteer Sign-Up - Users can register to assist with certain roles and tasks.
- d. Notification - Push notifications for announcements, scheduling changes, and reminders.
- e. Feedback System - After an event, participants can provide feedback.
- f. Calendar Integration - Events can be synced with Google Calendar or phone calendar.
- g. Location Mapping - Display venue on a map using GPS.

Non-functional Requirements

- Platform Compatibility - Requires support for both Android and iOS.
- User-friendly Interface - Simple and intuitive UX for all age group
- Scalability - The app should be able to manage an increase in the number of users and events
- Data Privacy - Ensure that data is stored securely and shared only with consent.

Document and Tracing :

To ensure all requirements are clearly written and traceable, the following practices will be implemented.

Requirement Specification Document (RSD): All functional and non-functional requirements will be properly documented in a systematic manner.

Use Case Diagrams and User Stories – These will illustrate how users interact with the system.

The Requirement Traceability Matrix (RTM): It is a table that connects each requirements to the relevant feature, design component, and test case.

Version Control – Any changes to the requirements will be documented with timestamps and authors information for transparency.

This mock interview provided us with useful insights into customer expectations and main functionality. By systematically documenting and tracing these requirements, we establish a solid foundation for the community app's design, development and testing.
